C L A I M T E C

SOLUTION SCOPE

CLAIMTEC FINOPS

Turning a decline into a second chance to lend.

Two revenue-recovery journeys on the Claimtec FinOps platform: an affordability-decline upsell that offers every declined buyer the vehicle they *do* qualify for, and a reactivation engine that re-opens the book of applications lost to "unable to contact". This document sets out both journeys, the scope of work, and what we need from the Bank to begin.

§01 · WHAT WE ARE BUILDING. WHY IT MATTERS TO THE BOOK.

Executive summary

Most lenders treat a decline as the end of a conversation. The Claimtec FinOps platform treats it as the start of a better one. This scope adds two journeys that recover revenue the Bank has already paid to originate.

The operating model. Absa continues to originate and decision every application in its own systems — nothing about the Bank's credit process changes. When an application is declined, Absa sends that declined record to Claimtec. Claimtec is the **recovery layer**: we ingest the declined feed, run each case through the appropriate recovery flow, and hand a re-engaged, re-qualified lead back to Absa to re-originate. Two flows sit on top of that feed:

- **Affordability-decline upsell.** Absa declines a buyer because the vehicle they chose is beyond their means. We re-engage that buyer, tell them what they *can* afford, and put an affordable vehicle in front of them — returning a re-qualified lead to Absa for a smaller, fundable deal.
- **Can't-contact reactivation.** Absa declines an application because it could not reach the applicant. We ingest it, *trace fresh contact details from external data sources* when the number on file is dead, re-establish contact, and return the applicant — with verified details — to Absa.

> ***Absa originates; Claimtec recovers. Both flows monetise customers the Bank has already acquired and declined — with no change to the Bank's credit policy and no new lead-generation spend.***

At a glance

Layer	What the Bank gets	Dependency
0 · Decline-feed ingestion	A secure intake that receives Absa's declined records and routes each to the right recovery flow. The shared front door for both journeys.	FEED SPEC FROM ABSA
A · Affordability upsell	A tracked flow that re-engages affordability-declined buyers and returns re-qualified, affordable leads to Absa.	NONE ONCE FEED IS LIVE
B · Contact reactivation	A flow that traces fresh contact details, re-establishes contact, and returns verified applicants to Absa.	GATED — SEE §06

Recommended sequencing: stand up the decline-feed intake, then ship Workstream A first — it needs only the feed and proves the recovered-revenue model while the Workstream B tracing and compliance dependencies are cleared.

§02 · WHAT WE HEARD. WHAT YOU ARE BUYING.

Understanding the brief

The Bank's ask, in its own terms: use the platform to upsell affordability declines, and to update the contact details of applicants declined because they could not be reached.

The problem, quantified

Two segments of the Bank's declined population carry recoverable value that today falls out of the funnel entirely:

- **Affordability declines.** A buyer qualifies for finance — just not for the vehicle they picked. Today they are declined and lost. In reality they are a fundable customer attached to the wrong asset.
- **Unreachable declines.** An application is declined solely because the Bank could not make contact — a stale number, a changed email. The credit appetite may be intact; only the contact channel failed.

What "good" looks like

CLAIMTEC (RECOVERY LAYER)

- ✓ Ingest Absa's declined-application feed
- ✓ Re-engage affordability declines with a pre-qualified offer
- ✓ Show affordable vehicles in the buyer's real band
- ✓ Trace fresh contact details from external data sources
- ✓ Re-contact + refresh details over WhatsApp
- ✓ Return re-qualified leads + verified details to Absa
- ✓ Report the recovery funnel back to the Bank

ABSA (UNCHANGED) / OUT OF SCOPE

- Origination & credit decisioning — stays in Absa's systems
- Re-origination of the leads we return
- Disbursement & payout
- Any change to the Bank's credit policy or rules
- Step-down / restructured finance products
- Marketing to non-declined populations

> ***Claimtec sits between Absa's decline and a second, better-matched application. It does not change who Absa approves — it changes what happens to the customers Absa has already declined, recovering the ones who were always fundable.***

§03 · THE JOURNEY, END TO END. TWO PATHS, ONE PLATFORM.

The customer journey

This is the heart of the engagement — what a declined customer actually experiences, and how each journey returns them to a fundable state.

Journey A — the affordability-decline upsell

Absa has declined the buyer for their chosen vehicle on affordability and sent the declined record to Claimtec. Instead of a dead end, we re-engage the buyer, put an affordable vehicle in front of them, and return a re-qualified lead to Absa.

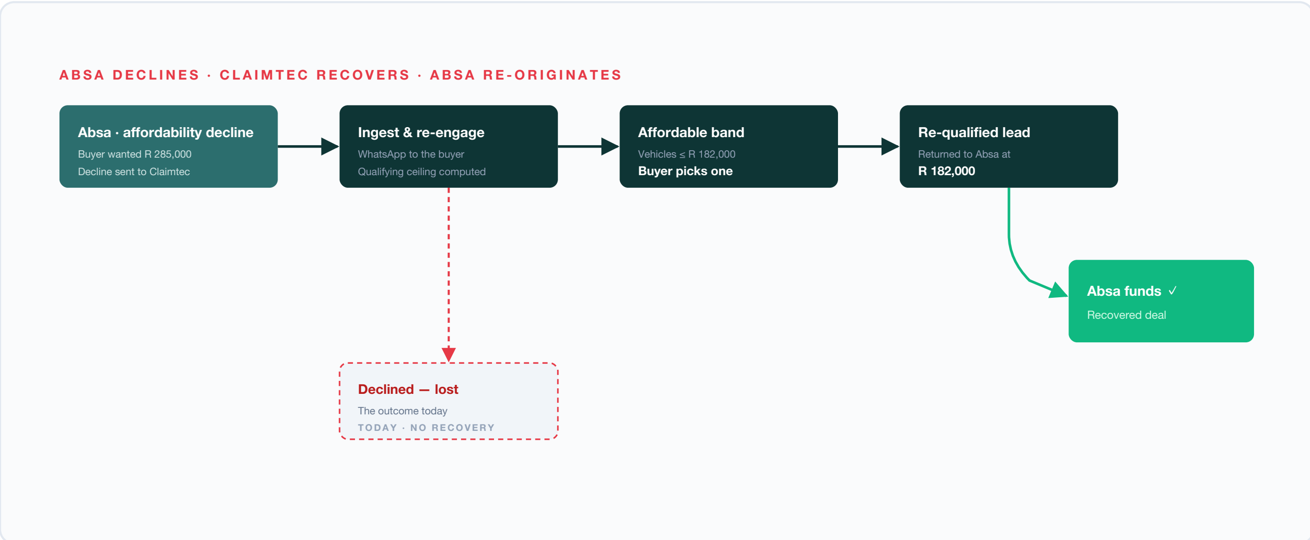

Figure 1 — Absa declines on affordability (left). Today the buyer is lost (red branch). Claimtec re-engages, matches an affordable vehicle, and returns a re-qualified lead to Absa to fund.

1
Absa declines
Affordability fails for the chosen vehicle; Absa sends the declined record to Claimtec.

2
Re-engaged
We reach the buyer on WhatsApp and compute their true qualifying ceiling.

3
Guided
Vehicles in the affordable band are surfaced — real listings, in the buyer's range.

4
Returned
The buyer picks an affordable vehicle; a re-qualified lead goes back to Absa.

5
Absa funds
A deal that would have been lost completes — attributed to the upsell journey.

> ***"You applied for R 285,000 and it was declined — but you pre-qualify for up to R 182,000. Here are cars in your range." One message turns a rejection into a recovered sale.***

Journey B — the can't-contact reactivation

Absa declined the application only because it could not reach the applicant — the number on file is dead. Re-dialling it is useless, so before we make contact we **trace fresh details from external data sources**, then re-establish contact, confirm the update, and return the applicant to Absa.

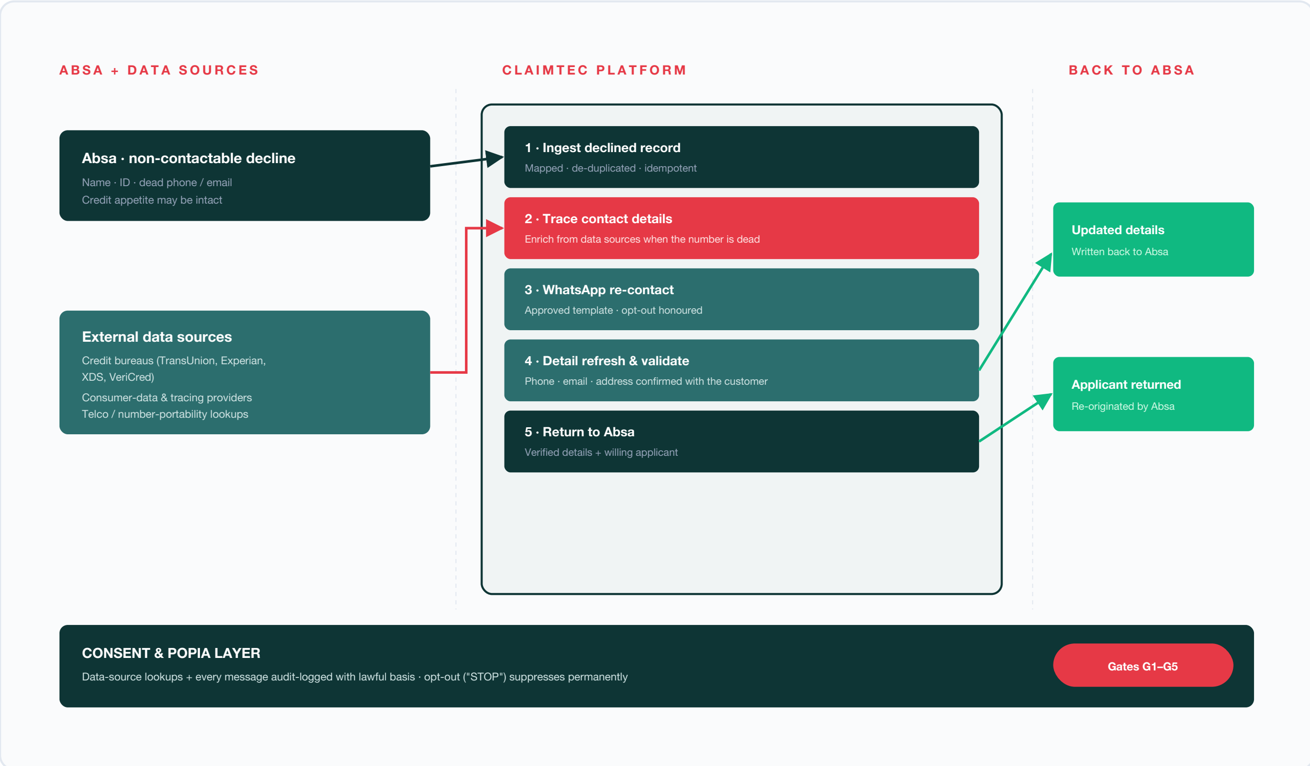

Figure 2 — When Absa's number is dead, the platform traces fresh details from external data sources (red step) before re-contacting, then returns verified details and the applicant to Absa. Every step sits on the consent & POPIA layer.

1

Ingested

Absa's non-contactable decline is received and routed into the reactivation flow.

2

Traced

Fresh contact details are enriched from external data sources when the number is dead.

3

Re-contacted

The assistant reaches the applicant over WhatsApp on an approved template.

4

Refreshed

Phone, email and address are confirmed with the customer and validated.

5

Returned

Verified details and the willing applicant are handed back to Absa.

Where the two journeys converge

Any Absa decline — affordability or contact — enters the same Claimtec recovery layer and is returned to Absa to re-decision. If a reactivated applicant is then declined on affordability, the upsell journey catches them automatically. The two journeys chain into one continuous path: from any decline, back to a funded deal.

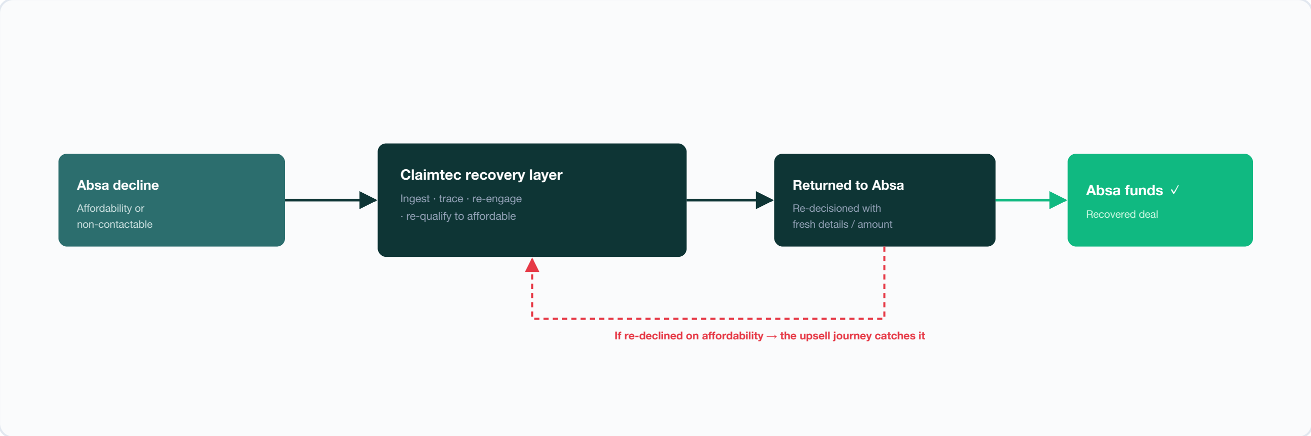

Figure 3 — One recovery layer serves both decline types and returns leads to Absa. A reactivated applicant re-declined on affordability loops back into the upsell journey (red).

> ***The commercial case is the compounding effect: reactivation refills the top of the funnel with customers the Bank had written off, and the upsell catches those who still can't afford their first choice. Every declined customer gets exactly one more, well-matched chance to become a funded deal — and the Bank sees each step of that recovery, measured and attributable.***

What Absa sees

Across both journeys the platform reports a single recovery funnel — from the moment Absa declines or flags a customer unreachable, through tracing, re-contact and re-qualification, to a lead returned and funded. That funnel is the number this engagement is measured on, and it is visible to Absa's recovery team in real time on the Claimtec operator dashboard.

§04 · PHASES. SIGN-OFF CRITERIA ON EVERY ONE.

Scope — Workstream A

Layer 0 · Decline-feed ingestion (shared)

Both journeys begin with the same front door: a secure intake that receives Absa's declined records, normalises and de-duplicates them, and routes each case by decline reason — affordability into Journey A, non-contactable into Journey B. This layer is built once and serves both workstreams.

Phase	Deliverable	Sign-off criteria
L0 · Decline-feed intake	A secure endpoint that receives Absa's declined-application feed, maps and de-duplicates it, and routes each record by decline reason.	A test batch of declined records is ingested, correctly routed by reason, and idempotent on re-run.

Journey A · affordability upsell

Once the feed is live, the upsell flow carries no further external dependency. Delivered in four phases, each invoiced against its sign-off criteria.

Phase	Deliverable	Sign-off criteria
A1 · Qualifying-band engine	The platform converts the declined application into a concrete maximum qualifying vehicle price, using Absa's rate and term matrix.	For a given income profile, the platform states a correct affordable ceiling.
A2 · Re-engage & offer	The buyer is re-contacted on WhatsApp with a pre-qualified offer — the qualifying amount plus vehicles filtered to that band.	A declined buyer receives their qualifying amount and band-correct vehicle options.
A3 · Return to Absa	The buyer selects an affordable vehicle; a re-qualified lead is packaged and returned to Absa to re-originate, linked to the original application.	A declined case produces a linked, affordable lead handed back to Absa.
A4 · Upsell reporting	An operator view of the upsell funnel — ingested, engaged, returned, funded — with an export back to Absa.	The dashboard shows the upsell funnel; a periodic export produces per-case outcomes.

Phase A1 depends on Absa supplying its rate/term matrix so the qualifying-ceiling calculation reflects real product terms rather than an assumption.

§05 · PHASES. SIGN-OFF CRITERIA ON EVERY ONE.

Scope — Workstream B

Can't-contact reactivation. Built on the shared decline-feed intake (Layer 0) and delivered in five phases behind a set of compliance gates (§06). The defining new capability is contact tracing — enriching dead contact details from external data sources before any outbound message is attempted.

Phase	Deliverable	Sign-off criteria
B1 · Reason routing	Non-contactable declines from the Layer 0 intake are routed into the reactivation flow with their original context preserved.	Non-contactable records land in the reactivation queue, correctly separated from affordability declines.
B2 · Contact tracing & enrichment	An enrichment step that queries accredited external data sources — credit bureaus, consumer-data and tracing providers, telco lookups — to obtain fresh, verified contact details when the number on file is dead.	For a test set with stale numbers, the platform returns candidate fresh contact details with a confidence and source trail.
B3 · Outbound campaign engine	A throttled, opt-out-aware engine that re-contacts the traced applicant on an approved template and tracks every send.	The engine sends to a test cohort, tracks delivery and reply, honours opt-out — every send audit-logged with its lawful basis.
B4 · Detail-refresh flow	On reply, the assistant confirms and updates phone, email and address with the customer, validating each as captured.	A replying applicant has verified, updated contact details captured.
B5 · Return & reporting	Verified details and willing applicants are handed back to Absa; the reactivation funnel is reported per campaign — ingested, traced, contacted, updated, returned.	Updated details are returned to Absa and the funnel is visible per campaign.

> ***Contact tracing (B2) is what makes reactivation work at scale. A dead number is a dead end without it; with it, the Bank reaches applicants it had genuinely lost.***

§06 · WHAT WE PIN DOWN. WHAT WE NEED FROM YOU.

Dependencies & compliance

Both journeys move the platform from inbound — where the customer messages first — to outbound, where we message first. That is a compliance gate, not a technical one, and it defines the critical path for Workstream B.

Compliance gates

Gate	What it is	Owner
G1 · Consent confirmation	Written confirmation that the consent captured at original application covers re-contact **and** tracing/enrichment via external data sources. Blocks all outbound and all lookups.	Absa legal
G2 · Message templates	Two to three WhatsApp templates submitted for approval — reactivation opener, detail-confirm, opt-out acknowledgement.	Claimtec + Absa
G3 · Data agreement	A data-processing agreement covering the declined feed and the enriched contact data, both bulk personal information under POPIA.	Absa + Claimtec
G4 · Decline-feed spec	How Absa sends declined records to Claimtec — transport, authentication, field mapping, cadence, and the decline-reason codes that drive routing.	Absa
G5 · Data-source access	Access to the tracing/enrichment sources — via Absa's existing bureau relationships where possible, or Claimtec-held agreements — with the lawful basis for each lookup.	Absa + Claimtec

> ***G1 is the cheapest gate to get wrong and the most expensive to get wrong late. No outbound message is sent until the Bank's legal team has confirmed the consent basis in writing.***

What we need from Absa

- **Decline feed.** How Absa sends declined records to Claimtec — transport, fields, cadence, and the decline-reason codes that route each case (gate G4).
- **Rate & term matrix.** The rates and terms per risk band, so the qualifying-ceiling calculation (A1) reflects real product terms.
- **Consent scope, in writing.** Confirmation that application consent covers both re-contact and data-source tracing (gate G1).
- **Data-source position.** Which bureaus / tracing providers Absa already holds agreements with, so enrichment runs under existing relationships where possible (gate G5).

- **Volume & cadence.** How many declines per month, split by reason — this sizes the messaging tier, the enrichment budget, and infrastructure.
- **Return path & success definition.** How re-qualified leads and refreshed details return to Absa, and whether success is measured on updated details, returned leads, or funded deals.

Assumptions

- Absa continues to originate and decision every application; Claimtec operates only on declined records Absa sends, and returns leads for Absa to re-originate.
- WhatsApp remains the primary contact channel; the messaging provider and number are reused.
- Enrichment lookups are billed as a pass-through where a data source charges per query; these are indicative and separate from the fixed phase fees.
- Commercials for each phase are presented as fixed fees against the sign-off criteria above, in an accompanying quotation.

§07 · ONE SIGNATURE EACH. WE START WITH WHAT'S UNBLOCKED.

Next steps & acceptance

Acceptance of this scope authorises Claimtec to stand up the decline-feed intake and begin Workstream A once the feed is available, and to open the five compliance gates for Workstream B in parallel. A phased quotation with fixed fees accompanies this document.

Immediate next steps

1

Accept scope

Sign below to confirm the two journeys and their phasing.

2

Open the gates

Absa legal starts G1; both parties start G2–G5 and the feed spec.

3

Build A

Feed intake + upsell begin as soon as the feed spec lands.

4

Sequence B

Reactivation + tracing begin as each gate clears.
